

WELCOME

SAFAI by Team-101

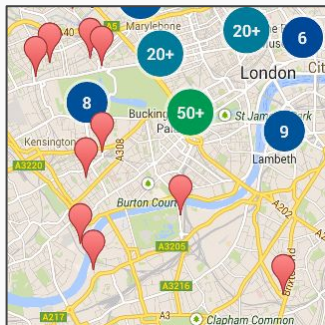

SAFAI

- SAFAI is a full stack solution to waste management problems that are emerging these days in metro cities.
- It aims to optimise the waste collection and management systems of the evolving “smart cities”.

FEATURES....

Garbage Pickup Optimised

Optimised garbage collection techniques reducing the cost.

1

Smart Bins

Smart Bins will tell automatically if they are full or not. If full, they will be picked first.

2

3

Dustbin Nearby

New to a locality and seeing no place to dump your garbage, just use this feature to find one.

4

5

Request dustbin

Found a place with trash but no trash bin? Request on the app and we'll deploy one

Waste Identification

Capture image to identify different kinds of waste

The Problems

- Ineffective allocation of trucks in localities, non regularity of pickup trucks.
- Most of solid waste management budget is allocated to collection and transportation, leaving very less for processing waste collected in landfills.
- Lack of motivation to separate the waste into recyclable and non recyclable.
- No way to dispose off large waste

Garbage Pickup Optimised

- Our app will provide users the facility to call for trash pickup truck whenever required.
- Users will deposit their trash to the collection boy in two separate bins, recyclable and non recyclable bins. The user will be given incentive based on the weight of recyclable waste he/she deposits and the type of recyclable waste. Users who on the other hand are earning incentive will help us save our labour in separating the trash into recyclable and non recyclable.
- Waste collected on days of parties/marriages is huge in amount. User can schedule a pickup next morning.
- Garbage pickup trucks' paths have been optimised, to navigate to only the nearest places where bins are located. We achieved this by Clustering the locations of Trash Bins on Google Maps.

Unexpected Problem....

If a trash bin unexpectedly get filled up, garbage cumulates around it, leading to unhygiene around it.

SAFAI provides a full stack solution to the imminent waste management requirements

How we solved it...

(Concept of **SMART BIN**)

Dustbin fitted with Beacon, generates a response as it fills completely, calling nearby pickup trucks to empty out the bin as soon as to prevent littering outside the bin.

Beacon

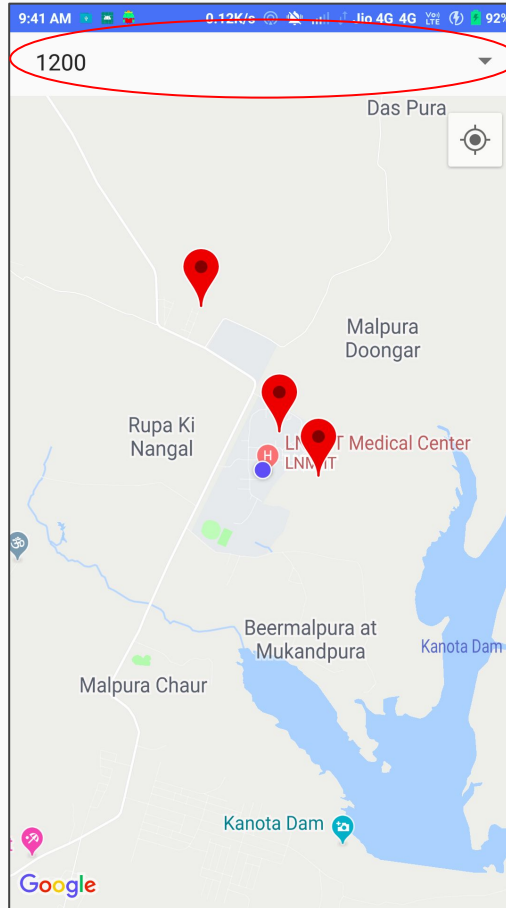

Beacon App....

This is the app for drivers. It will tell them the status of bins in their range(70 - 450m).

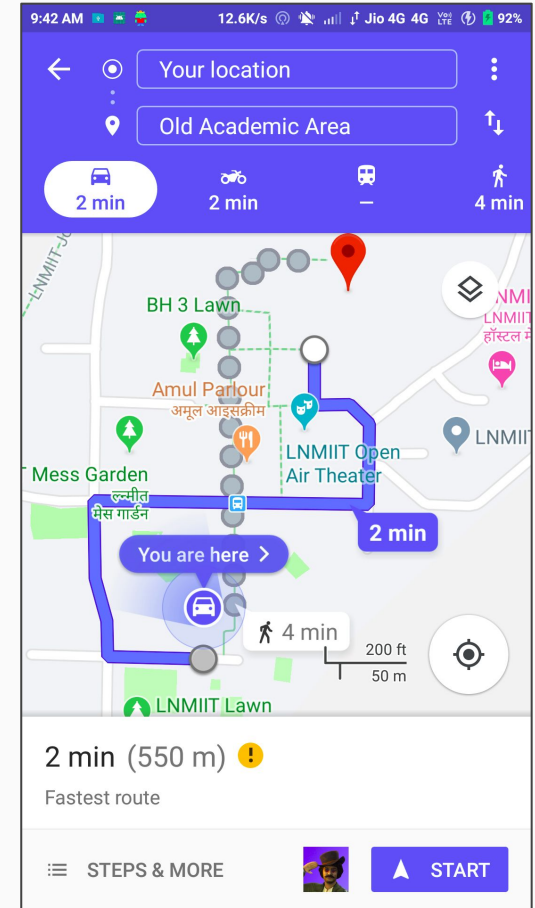

New to a Locality !!!

- The user can set the maximum radius and get all the dustbins in that radius and navigate to any of them.
- There is also a facility to add a new bin that is not present in the database.
- He can also request for a new bin to be installed at a location.

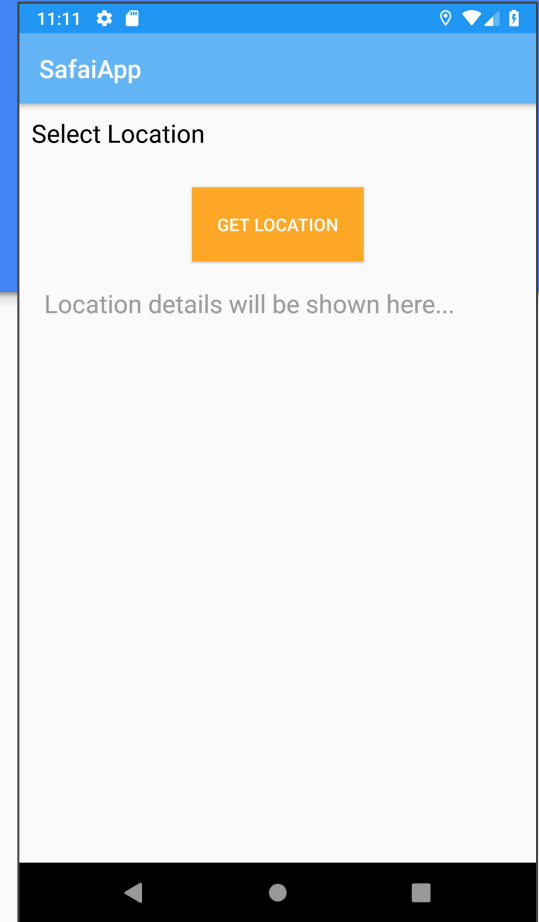

All dustbins within 1200 metres of current location.

Navigate to any one of them

Want to request a new dustbin?

The user can make a request on the app to install a new dustbin if he thinks there should be a dustbin at his location. The request will be processed if there are no nearby dustbins around the place the user requested for.

Garbage Identification

- Classify the type of garbage that user throws in the bins. This will help us separate the recyclable waste into separate categories, for eg paper, metal, cardboard, glass etc.

```

Next Steps....

The following are the features we are planning to add in the future :-

- To enable real time identification of garbage through video surveillance throughout the city or major parts of city and tourists places. The amount of garbage will be calculated and if it exceeds a certain limit, the authorities will be notified.
- Design a good algorithm to give incentives to users.
- To collaborate with the local network of garbage collectors.

THANKS
